	1 year	2 years	3 years	4 years
<b>Vein</b>	<b>77%<sup>†</sup></b> N = 2,936	<b>58%<sup>†,‡</sup></b> N = 1,272	<b>63%<sup>†</sup></b> N = 675	<b>62%<sup>†,‡</sup></b> N = 615
<b>GORE® PROPATEN® Vascular Graft</b>	<b>75%<sup>§</sup></b> N = 971	<b>65%<sup>§</sup></b> N = 782	<b>56%<sup>§</sup></b> N = 703	<b>46%<sup>§</sup></b> N = 693
<b>ePTFE Vascular Graft</b>	<b>60%<sup>†</sup></b> N = 2,549	<b>46%<sup>†</sup></b> N = 2,249	<b>40%<sup>†</sup></b> N = 1,941	<b>29%<sup>†</sup></b> N = 599

\* Weighted Average = 
$$\frac{(N_1 \times \text{Primary Patency}_1) + (N_2 \times \text{PP}_2) + \dots + (N_n \times \text{PP}_n)}{N_1 + N_2 + \dots + N_n}$$

† Data based on an analysis of current literature: several MEDLINE® Database searches were performed to identify publications pertaining to ePTFE synthetic vascular graft and vein infragenicular bypasses. Search criteria included (1) articles published from January 2000 to January 2012, (2) key words used were below knee, polytetrafluoroethylene, prosthetic, bypass, patency, (3) articles in English language, (4) N equal or greater than 30 bypasses, (5) clinical publications, (6) reviews, case reports or meta-analysis articles were excluded, (7) articles containing the key word AV access (including synonyms) were excluded. Articles that did not meet the above criteria were deemed ineligible for this analysis. (data on file 2019; W. L. Gore & Associates, Inc; Flagstaff, AZ.)

‡ In studies where 1-year and 3-year patency data were reported, but 2-year patency data were not reported, the 2-year patency rate used in this analysis was interpolated as the average of the 1-year and 3-year patency rates.

§ Below-knee (BK) inclusion criteria for GORE® PROPATEN® Vascular Graft literature used in this analysis were (1) articles in English language, (2) clinical journal articles or book chapters, (3) non-overlapping patient populations, (4) BK bypass primary patency reported for at least 12 months of follow-up and (5) N = 50 or more BK bypasses. Additional exclusion criteria were (1) reviews, case reports or meta-analysis articles and (2) articles containing the key word AV access (including synonyms). (data on file 2019; W. L. Gore & Associates, Inc; Flagstaff, AZ.)

# Comparison of propaten heparin-bonded vascular graft with distal anastomotic patch versus autogenous saphenous vein graft in tibial artery bypass<sup>1</sup>

Kaisar et al. 2018

Michael E. DeBakey Department of Surgery, Baylor College of Medicine, Houston, TX, USA

"Propaten grafts [GORE® PROPATEN® Vascular Graft] with distal anastomotic patch have similar clinical outcomes compared to the saphenous vein graft in tibial artery bypass. Our data support the use of Propaten graft [GORE® PROPATEN® Vascular Graft] with distal anastomotic patch as a viable conduit of choice in patients undergoing tibial artery bypass." — J. Kaisar

## Comparison of venous and HePTFE tibial and peroneal bypasses in critical limb ischemia patients unsuitable for endovascular revascularization<sup>2</sup>

Uhl et al. 2015

Department of Vascular Surgery, Krankenhaus Barmherzige Brüder, Regensburg, Germany

“The results of our study show that autologous vein grafts are still first choice for tibial and peroneal bypasses in patients with critical limb ischemia. If no adequate vein is available, heparin-bonded expanded polytetrafluoroethylene bypasses are an acceptable alternative to an otherwise impending major amputation.” — C. Uhl

## Heparin-bonded ePTFE (Propaten): is it as good as autologous vein for tibial bypass?<sup>3</sup>

Neville et al. 2014

Division of Vascular Surgery, George Washington University, Washington, DC, USA

“This experience with heparin-bonded ePTFE grafts for solely tibial artery bypass yielded patency and limb salvage rates that are comparable to intact great saphenous vein.” — R. Neville

“We believe that a quality saphenous vein remains the ideal conduit for tibial bypass, although HePTFE should be considered when intact ipsilateral or contralateral vein is not available. In our practice, HePTFE has emerged as the choice over arm vein, especially in the ESRD patient who needs upper extremity vein for dialysis access. We would also choose HePTFE over composite short saphenous vein given the increased dissection required and length of conduit.” — R. Neville

## Subpopliteal revascularization. Criteria analysis for the use of E-PTFE (Propaten®) as first choice conduit<sup>4</sup>

Monaca et al. 2013

Vittorio Emanuele Policlinic University Hospital, Presidio Ospedaliero "Ferrarotto", Catania, Italy

### Primary patency of GORE® PROPATEN® Vascular Graft

Patient characteristics	Study details

“...in low thrombotic risk patients mid-and long-term patency of vein and Propaten® graft [GORE® PROPATEN® Vascular Graft] is comparable. In case of PTFE use, we reported shorter surgery time, reduced hospital stay and wound complications. These observations led us to primarily choose the prosthetic graft in that subset of cases, saving the VSG [great saphenous vein] for distal revascularization in case of occlusive disease progression.” — V. Monaca

## Results from an Italian multicentric registry comparing heparin-bonded ePTFE graft and autologous saphenous vein in below-knee femoro-popliteal bypasses<sup>5</sup>

Dorigo et al. 2012

Department of Vascular Surgery, University of Florence, Florence, Italy

### Primary patency of GORE® PROPATEN® Vascular Graft

Patient characteristics		Study details	
Arterial hypertension <b>87%</b> N = 482	Diabetes <b>46%</b> N = 253	<ul style="list-style-type: none"> <li>Retrospective, non-randomized, multicenter analysis</li> <li>Comparing GORE® PROPATEN® Vascular Graft and autologous saphenous vein</li> <li>There was no statistically significant difference in secondary patency or limb salvage between GORE® PROPATEN® Vascular Graft and autologous saphenous vein</li> </ul>

“...we had a 13% increase in secondary patency rates in ePTFE group, whereas the corresponding figure was only 6% in patients with occluded vein, thus confirming both the possibility of effectively treating occluded heparin-bonded grafts and the difficulty of dealing with occluded vein bypasses.” — *W. Dorigo*

“In patients with critical limb ischemia, the rates both of amputations at 4 years and of amputation-free survival were not different between autologous vein and heparin-bonded ePTFE... and this is an encouraging result, considering that limb salvage probably represents the main outcome in all these critical patients.” — *W. Dorigo*

## Midterm results from a multicenter registry on the treatment of infrainguinal critical limb ischemia using a heparin-bonded ePTFE graft<sup>6</sup>

Pulli et al. 2010

Department of Vascular Surgery, University of Florence, Italy

“...the good results at 3 years in primary interventions in patients with more than one distal vessel and with rest pain could suggest a significant role of the heparin-bonded graft in these subgroups of patients.” — R. Pulli

“Primary and secondary patency rates make this graft an excellent alternative to autologous saphenous vein when it is absent, unsuitable, or of poor quality.” — R. Pulli

## Heparin-bonded ePTFE grafts compared with vein grafts in femoropopliteal and femorocrural bypasses: 1- and 2-year results<sup>7</sup>

Daenens et al. 2009  
University Hospital Gasthuisberg, Belgium

“In this large retrospective study, heparin-bonded ePTFE grafts had 1- and 2-year primary patency results that were not significantly different from those for ASV grafts. Results in BK FP and FC applications were especially promising.” — *K. Daenens*

“Overall, our results...provide solid additional evidence that heparin-bonded ePTFE grafts represent an important new option in the treatment of peripheral arterial disease.”

— *K. Daenens*

PEPE II — A multicenter study with an end-point heparin-bonded expanded polytetrafluoroethylene vascular graft for above and below knee bypass surgery: determinants of patency<sup>8</sup>

“...present data show that using the endpoint heparin bonded ePTFE graft for lower limb revascularization produces excellent results for AK bypasses and encouraging results for BK bypasses, when compared with data obtained from studies which used other prosthetic material. These encouraging results for BK bypasses were even seen in the subgroup of patients that generally have worse revascularization results due to the presence of risk factors.” — B. Hugl

“...our data suggests that the use of this graft is an excellent option when no autologous vein is available.” — B. Hugl

\* GORE® PROPATEN® Vascular Graft group.

“These data show that the Propaten HePTFE graft [GORE® PROPATEN® Vascular Graft] offered significantly better long-term patency over the SePTFE graft, suggesting Propaten [GORE® PROPATEN® Vascular Graft] as the prosthetic graft of choice for bypasses to the femoropopliteal artery when autologous vein is unavailable or inappropriate.” — R. Samson

“Propaten HePTFE grafts [GORE® PROPATEN® Vascular Grafts] seem to be as effective as vein for AK femoropopliteal artery bypass. Because of the excellent results observed in this series, we now use the Propaten graft [GORE® PROPATEN® Vascular Graft] preferentially over great saphenous vein for AK bypass except in younger patients with available appropriate autologous conduit.” — R. Samson

## The Scandinavian Propaten® Trial — 1-year patency of PTFE vascular prostheses with heparin-bonded luminal surfaces compared to ordinary pure PTFE vascular prostheses — a randomized clinical controlled multi-centre trial<sup>13</sup>

Lindholt et al. 2011

Vascular Research Unit, Department of Vascular Surgery, Viborg Hospital, Denmark

### Primary patency of GORE® PROPATEN® Vascular Graft

“In the light of these in vivo results, we speculate that a decrease in platelet and thrombus deposition on the CBAS ePTFE graft surface may have contributed to the promising 1-year patency rates in our clinical series. Although amelioration of intimal hyperplasia is not the primary target of heparinization technology, it is intriguing to consider the possibility that the CBAS graft surface might simultaneously address two sources of graft failure: thrombosis and intimal hyperplasia.” — M. Bosiers

“Our findings... indicate that use of this graft is an excellent option for infrainguinal bypass grafting in patients with peripheral vascular disease when autologous vein is not available.” — M. Bosiers

15. CBAS Heparin Surface. W. L. Gore & Associates website. Accessed April 14, 2020. <https://www.goremedical.com/cbas/references>.

Features Gore's CBAS Heparin Surface, the proven heparin bonding technology for lasting thromboresistance, used in many of Gore's interventional and vascular surgery products. End-point covalent bonding keeps heparin anchored to the graft surface, while the bioactive site remains free to interact with the blood to help prevent clotting.<sup>15</sup>

**INDICATIONS FOR USE:** GORE® PROPATEN® Vascular Grafts are intended for use as vascular prostheses for replacement or bypass of diseased vessels in patients suffering occlusive or aneurysmal diseases, in trauma patients requiring vascular replacement, for dialysis access, or for other vascular procedures. **CONTRAINDICATIONS:** A. DO NOT use the GORE® PROPATEN® Vascular Graft in patients with known hypersensitivity to heparin, including those patients who have had a previous incidence of Heparin-Induced Thrombocytopenia (HIT) type II. B. DO NOT use any configuration of GORE® PROPATEN® Vascular Grafts with Removable Rings, Non-Removable Rings or Integrated Rings for coronary artery bypass or cerebral reconstruction procedures. C. DO NOT use GORE® PROPATEN® Vascular Grafts as a patch. If cut and used as a patch, GORE® PROPATEN® Vascular Grafts may lack adequate transverse strength. Refer to *Instructions for Use* at [eifu.goremedical.com](http://eifu.goremedical.com) for a complete description of all applicable indications, warnings, precautions and contraindications for the markets where this product is available. ~~R~~only The articles listed here may include outcome descriptions that reflect use of devices outside the approved *Instructions for Use* (IFU), including data registries intended to provide broader information about patient outcomes. Gore does not promote the off-label use of devices. Physicians should consult the IFU for complete device information, including contraindications, warnings and cautions.
